

# SkyCal – What's New

---

## Version 3.1.0.0

- Modification of the Settings Dialog for later inclusion of MCT Adjust Assist. I'm working on improvements to the Adjust Assist to support optics other than SCT.
- Addition of the "What's New" menu item to keep users informed about changes in the latest update.
- Bug fix of an annoying "No Bahtinov Lines" error when selecting a star images.
- Improve the tracking of images when they move. Skycal is better at keeping images centred and displayed correctly when during adjustment.
- Change the Aperture and Focal Length values in the Settings dialog to accept decimal values.
